

Siding Choices

Western Red Cedar exterior siding or cladding comes in a spectrum of patterns and grades. Each pattern has a unique shape and style, which can be used in a multitude of design styles. Click the headings above to learn more about the types of siding we offer.

Quality Service

At Sound Cedar, we believe that the level of customer service should match the quality of our products. Our staff is friendly and knowledgeable, with years of experience in the building industry. We work directly with professional builders and homeowners, striving to give you the attention to detail that your project needs.

Bevel Siding

Western Red Cedar bevel siding is the most widely-used siding type. It is produced by resawing lumber at an angle to produce two pieces thicker on one edge than the other. The manufacturing process results in pieces with one face saw textured. The other face is smooth or saw textured depending on the grade and customer preference. Bevel siding is installed horizontally and gives an attractive shadow line which varies with the thickness of siding selected.

T&G Siding

The term pattern sidings describes a variety of siding products in which the board has been machined on the edge(s) and face(s) to produce siding with interlocking or overlapping joints and with smooth surfaced or rough sawn faces. These sidings fall into two broad groups: tongue & groove or lap.

Lap Siding

Lap sidings are supplied in a variety of patterns in clear or knotty grades and with a smooth or saw textured face.

Board and Batten Siding

Board-and-batten is a vertical design created using wide clear or knotty cedar boards spaced apart with narrower boards (battens) covering the joints. There are no set board or batten widths – various combinations are used to create different looks suitable for large or small scale applications. A frequent combination is 1 x 3 in. battens and 1 x 10 in. boards. This can also be reversed with boards installed over battens to create a deep channel effect.
